

Site Analysis

Project:

When designers visit the built environment, they are looking to understand current conditions, problems, and possibilities. They document their observations and thoughts both on site and when they return to their work space. Your task after visiting your site is to work with your studio to diagram what you noticed while you were exploring.

Instructions:

Your TA will lead you as a studio through using trace paper over maps of the area to diagram mobility networks, building grain/density, cultural patterns, and any other conditions that you may have noticed. You will also use these diagrams to begin to visualize as a studio how you think the area could transform in five years, ten years, and twenty years.

Deliverable(s):

A series of diagrams on trace paper documenting your studio's analysis.
