

Folded Objects as Occupiable Spaces in the City

Project:

Scale up your lamp investigation and consider how the form you developed could be reinterpreted as an occupiable space (building, pavilion, etc). These architectural forms should be located on your site and interact with the existing urban context in some way. Consider how they could be freestanding or even attach onto existing structures.

Instructions:

You should scale down the form you developed for your lamp to fit into a 4" x 4" square on the site. When you are doing this, consider how you can alter the existing design to either be freestanding and interact with the existing urban context or even attach onto the existing structures to create a symbiotic relationship. Before making your new physical model, sketch out how you can imagine this happening at at least 3 different places across your site.

It is important for you to work together with your studio, as you want your architectural interventions to be able to exist simultaneously. At this point you could even coordinate your efforts as a team in relation to your site analysis on Monday to improve wider conditions throughout the area.

Deliverable(s):

Sketches of 3 different potential interventions and your final model, located on the shared site model.
