

Light and Texture Studies

Project:

As designers, we usually have a specific vision in mind when it comes to light, color, and texture. In order to communicate this, we document models and complete projects very carefully through photography as well as drawing. For this project, experiment with the way that light, color, and texture interact with your models and photograph them under a variety of conditions.

Instructions:

Experiment with taking photographs of your models using the photo area. Try to establish at least three different lighting/texture/color conditions. Consider taking photos of your model in isolation and also combined with the models of others.

Deliverable(s):

Take photos on the provided camera in the photo area. If that camera is unavailable, use your phone and upload them to the link in the SDC app. You should have several different versions of photos.
